Chapter 1

Introduction

1.1 Overview

EduAtlas is a web-based platform that provides students with a centralized system to explore colleges, universities, and study abroad opportunities. It organizes educational information in a structured way, allowing users to access relevant data from a single platform.

The system offers a simple and user-friendly interface for efficient navigation and information retrieval. Users can explore institutions, access academic resources, and interact with the platform easily.

By integrating multiple services into one environment, EduAtlas improves accessibility and enhances the overall experience of managing educational information.

1.2 Motivation

Students often face difficulties when searching for colleges, universities, or study materials. Information is scattered across multiple websites, making it difficult to compare options and find reliable data [1].

Another limitation is that many existing platforms provide either learning content or admission-related information, but fail to integrate both in a single system [2, 3].

The motivation behind EduAtlas is to build a centralized platform where students can:

- Explore institutions easily
- Access study materials
- Get admission-related documents

This system reduces time consumption and improves the overall user experience by providing organized and accessible information.

1.3 Problem Definition

1.3.1 Problem Statement

Students often face difficulties in finding reliable information about colleges, universities, and study abroad options. Information is scattered across multiple online platforms, making it challenging to compare institutions and make informed decisions [1].

Many existing platforms also fail to provide admission documents and study materials in a single place. As a result, students spend significant time searching for necessary resources across different sources [3, 4].

The problem is to design and develop a system that organizes institutional data, provides efficient filtering and search capabilities, and ensures easy access to admission guidance and academic materials.

1.3.2 Complex Engineering Problem

The EduAtlas system can be classified as a complex engineering problem as it involves multiple technical and practical challenges. The system requires the integration of various components such as user interface design, database management, and efficient data processing. It also needs to handle user requirements, system performance, and usability in a balanced way.

The key attributes of the complex engineering problem addressed in this project are summarized in Table 1.1.

Table 1.1: Summary of Attributes Related to **EduAtlas**

Name of the Attribute	Explanation on How to Address
P1: Depth of knowledge required	Requires knowledge of web development, database management, and user interface design
P2: Range of conflicting requirements	Balancing between simple user interface design and multiple system functionalities
P3: Depth of analysis required	Understanding user needs and organizing large amounts of data efficiently
P4: Practical Constraints	Managing large datasets, ensuring fast system performance, and maintaining usability

© Dept. of Computer Science and Engineering, GUB

1.4 Design Goals/Objectives

The primary objective of the EduAtlas project is to design and develop a web-based system that enables students to explore educational institutions and access academic resources in a simple and efficient manner.

- **Institution Discovery:** Enable users to browse colleges, universities, and study abroad options.
- **Filtering System:** Provide filtering options based on location and category.
- **Information:** Present essential details such as programs, requirements, cost of institutions.
- **Admission Help:** Provide access to admission-related documents and guidelines.
- **Study Materials:** Offer categorized academic materials for structured learning.
- **Feedback System:** Allow users to submit requests and provide feedback.
- **Bookmark Feature:** Enable users to save preferred institutions for future reference.
- **User-Friendly Design:** Ensure simple navigation and easy accessibility of information.

These objectives ensure that the system is not only functional but also efficient, user-friendly, and capable of supporting students in making informed academic decisions.

1.5 Application

EduAtlas can be used in various real-life scenarios to support students and enhance educational activities.

- **Students:** Helps school, college, and university students find suitable institutions and access relevant study materials.
- **Admission Seekers:** Assists students during the admission process by providing necessary documents and guidance.
- **Study Abroad Applicants:** Enables students to explore international educational opportunities and related information.
- **Teachers and Mentors:** Supports educators in guiding students using organized institutional and academic resource data.
- **Educational Planning:** Helps users make informed academic and career decisions based on structured information.
- **General Users:** Allows anyone interested in educational information to easily access and explore the platform.

These applications demonstrate that EduAtlas is a versatile and practical system that can support a wide range of users in accessing and managing educational information efficiently.

Chapter 2

Requirement Analysis and Design

2.1 Requirement Analysis

Requirement analysis is a crucial phase in system development, as it defines the functionalities and constraints of the system based on user needs. It helps in identifying what the system should accomplish and how it should perform in different scenarios.

For the EduAtlas system, requirements are determined by analyzing common challenges faced by students, such as difficulty in accessing reliable institutional information, lack of structured data, and limited availability of academic resources in a single platform.

To ensure a clear and systematic design, the requirements are categorized into functional and non-functional requirements.

2.1.1 Functional Requirements

For the EduAtlas system, the functional requirements are as follows:

- Allow users to explore institutions, including colleges, universities, and study abroad options.
- Enable searching of institutions based on name or location.
- Display institution details and enable bookmarking for future reference
- Provide access to admission-related documents in downloadable format.
- Allow users to submit feedback and request additional documents.

These functionalities ensure that the system operates effectively and supports user interaction in an organized and efficient manner.

2.1.2 Non-Functional Requirements

For the EduAtlas system, the non-functional requirements are as follows:

- **Performance:** The system should provide fast loading times and responsive interactions under normal usage conditions.
- **Usability:** The interface should be intuitive, simple, and easy to navigate for all types of users.
- **Security:** User data and system resources must be protected from unauthorized access and potential threats.
- **Scalability:** The system should efficiently handle increasing numbers of users and growing data volume.
- **Availability:** The system should remain accessible and operational with minimal downtime.

These requirements ensure that the system maintains high performance, reliability, and a positive user experience.

2.2 Tools and Techniques

The development of EduAtlas involves the use of modern web technologies. These tools are selected to ensure system efficiency, scalability, and ease of development.

- Frontend: HTML, CSS, JavaScript
- Backend: PHP
- Database: MySQL
- Libraries and Tools: Browser DevTools, File Manager(Control Panel)
- Version Control: ProFreeHost, Online MySQL

Using these tools allows the system to be developed in a modular and maintainable way, ensuring future improvements can be added easily.

Table 2.1: Gantt Chart for EduAtlas

2.4 Software development life cycle (SDLC) Selection

Table 2.1: Comparison Matrix with Different SDLC Models for EduAtlas

Priority	**Criteria**	**Waterfall**	**V-shape**	**Iterative**	**Spiral**	**Agile**	**Prototype**
5	Well defined requirements	Yes	Yes	No	No	Yes	No
4	Flexibility in changes	No	No	Yes	Yes	Yes	Yes
5	Efficiency	Yes	Yes	Yes	Yes	Yes	Yes
4	Risk handling ability	No	Yes	Yes	Yes	Yes	No
5	User involvement	No	No	Yes	Yes	Yes	Yes
4	Security and reliability	Yes	Yes	Yes	Yes	Yes	No
3	Development speed	No	No	Yes	No	Yes	Yes
Total	**Overall Score**	17	19	23	22	**29**	21

In this section, different SDLC models are compared to determine the most suitable development approach for the EduAtlas system. As a dynamic web-based platform with multiple modules, the system requires a flexible and user-oriented development process.

The comparison table evaluates models such as Waterfall, V-shape, Iterative, Spiral, Agile, and Prototype based on key criteria including requirement clarity, flexibility, efficiency, risk handling, user involvement, and development speed.

From the analysis, Agile achieves the highest overall score due to its support for continuous development, adaptability to changes, and strong user involvement. These characteristics make it highly suitable for a system like EduAtlas, where requirements may evolve during development.

Therefore, Agile is selected as the most appropriate SDLC model, ensuring flexibility, faster development, and improved system quality through iterative feedback.

2.5 System Architecture

2.5.1 High-Level Design

The high-level design of EduAtlas is based on a three-layer architecture that ensures clear separation between user interaction, system processing, and data management. This architectural approach improves maintainability, scalability, and overall system efficiency.

- **Presentation Layer:** Represents the user-facing interface through which users interact with the system, including searching institutions, viewing information, accessing documents, and submitting requests.
- **Application Layer:** Handles the core system logic and processing, such as managing search requests, filtering institution data, processing bookmarks, and handling study materials and feedback operations.
- **Data Layer:** Stores and manages all system data, including institution information, academic resources, bookmarks, and user-submitted requests.

Figure 2.1 presents the high-level architecture of the EduAtlas system. It illustrates how different types of user input and system features are connected to the central platform and how the platform interacts with the education database to retrieve and manage information.

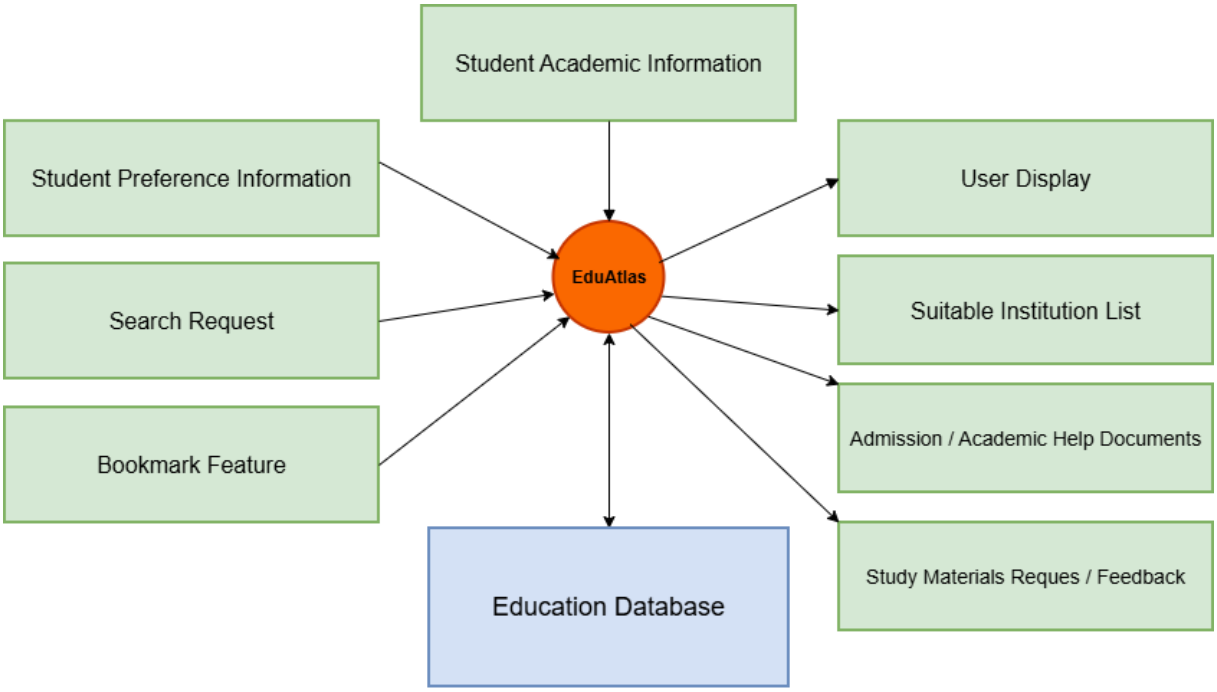

Figure 2.1: High-level architecture of the EduAtlas

This structure ensures proper separation of responsibilities and supports smooth communication between system components, resulting in better performance and easier system management.

© Dept. of Computer Science and Engineering, GUB

2.5.2 Low-Level Design

The low-level design of the EduAtlas system describes how user requests are processed through a structured workflow within the system.

When a user submits a request, it first goes through input validation to ensure correctness. The system then checks whether the request is valid and directs it to the appropriate processing unit.

- **Input Validation:** Verifies user inputs such as search queries and preferences.
- **Request Processing:** Directs valid requests to search or document retrieval modules.
- **Search and Filter Processing:** Processes institution search based on user criteria.
- **Document Retrieval:** Retrieves admission documents and study materials from the database.
- **Result Generation:** Produces the final output based on processed data.

If the requested resource is available, the system displays the result to the user; otherwise, an appropriate response is returned.

Figure 2.2 illustrates the detailed workflow of the EduAtlas system.

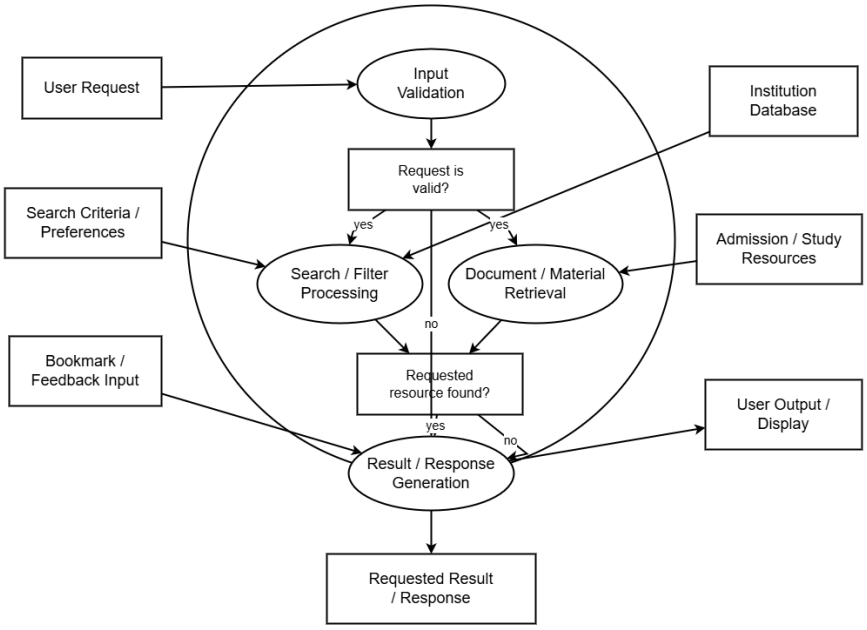

Figure 2.2: Low-level architecture (detailed workflow) of the EduAtlas

This design ensures efficient processing of user requests and smooth interaction between system components, resulting in reliable and responsive system performance.

© Dept. of Computer Science and Engineering, GUB

2.6 E-R Diagram

The Entity-Relationship (E-R) Diagram of EduAtlas represents the main entities of the system and their relationships. It shows how data is structured and connected within the database.

The key entities include **User**, **Student Profile**, **Institution**, **Subject**, **Bookmark**, **Study Material**, **Admission Help**, and **Feedback**. These entities are linked through relationships such as saving bookmarks, accessing resources, and submitting feedback.

This design ensures organized data management and supports efficient data retrieval within the system.

Figure 2.3 illustrates the E-R diagram of the EduAtlas system.

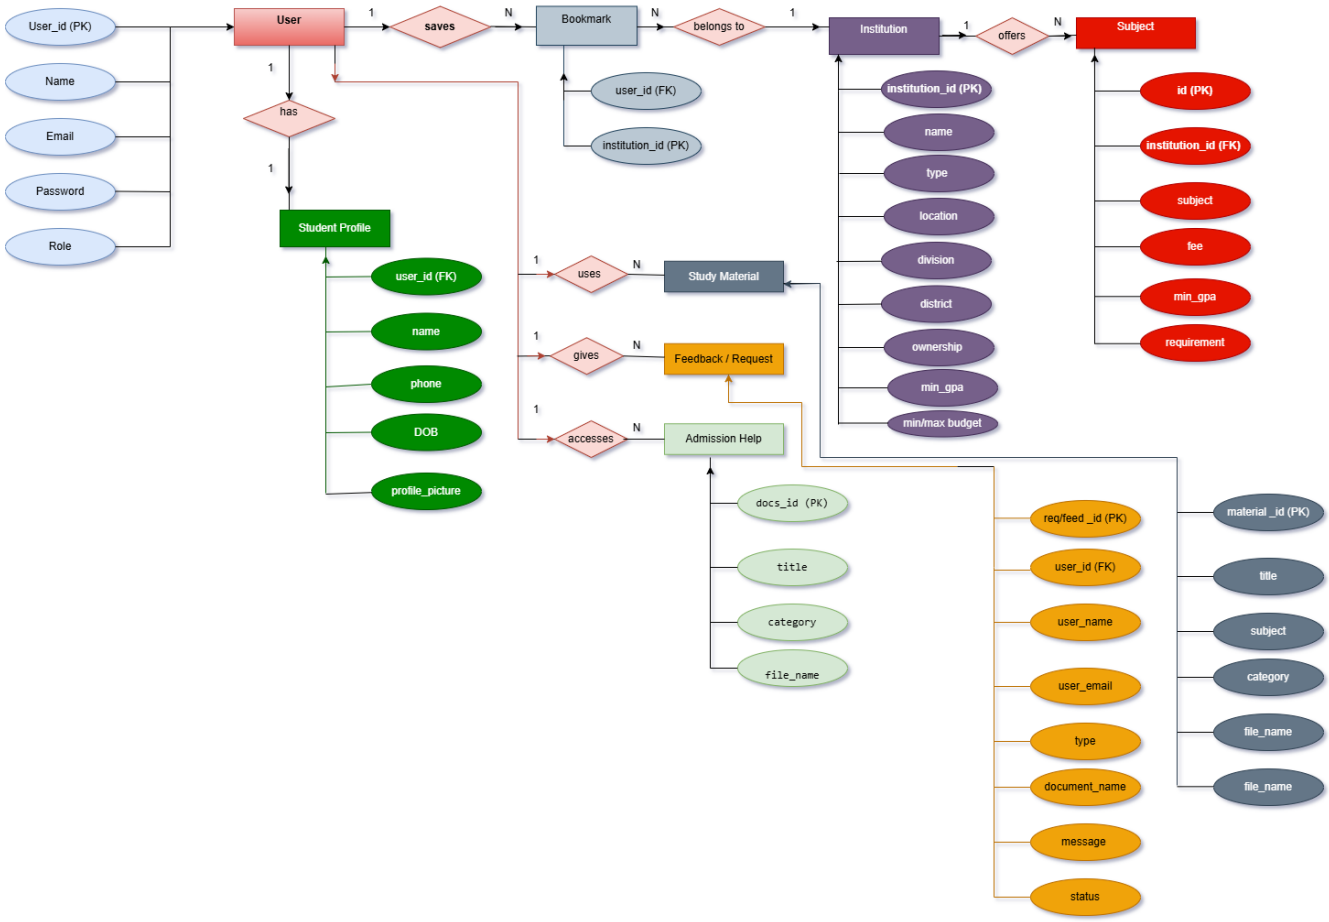

Figure 2.3: Entity Relationship Diagram of EduAtlas

© Dept. of Computer Science and Engineering, GUB

2.7 Database Schema

The database schema of EduAtlas defines how data is stored, organized, and managed within the system. It is designed to support core functionalities such as institution discovery, bookmarking, study materials access, admission resources, and feedback handling.

Database Tables:

- **users** (*user_id, name, email, password, role*)
- **student_profile** (*profile_id, user_id, ssc_gpa, hsc_gpa, group, budget, preferred_location*)
- **institutions** (*institution_id, name, type, division, district, min_gpa*)
- **subjects** (*subject_id, subject_name, fee, required_gpa, institution_id*)
- **bookmarks** (*bookmark_id, user_id, institution_id*)
- **study_materials** (*material_id, title, category, file*)
- **resources** (*resource_id, title, category, file*)
- **feedback** (*feedback_id, user_id, message, status*)

The **users** table stores authentication and basic user information, while the **student_profile** table maintains academic and preference-related data. The **institutions** table stores details of colleges, universities, and other educational options, and each institution is associated with multiple **subjects**.

The **bookmarks** table links users with their saved institutions. Academic resources are managed through the **study_materials** table, while admission-related documents are handled using the **resources** table. The **feedback** table stores user messages, requests, and system responses.

This schema ensures structured data management and supports efficient querying, filtering, and user-based operations within the system.

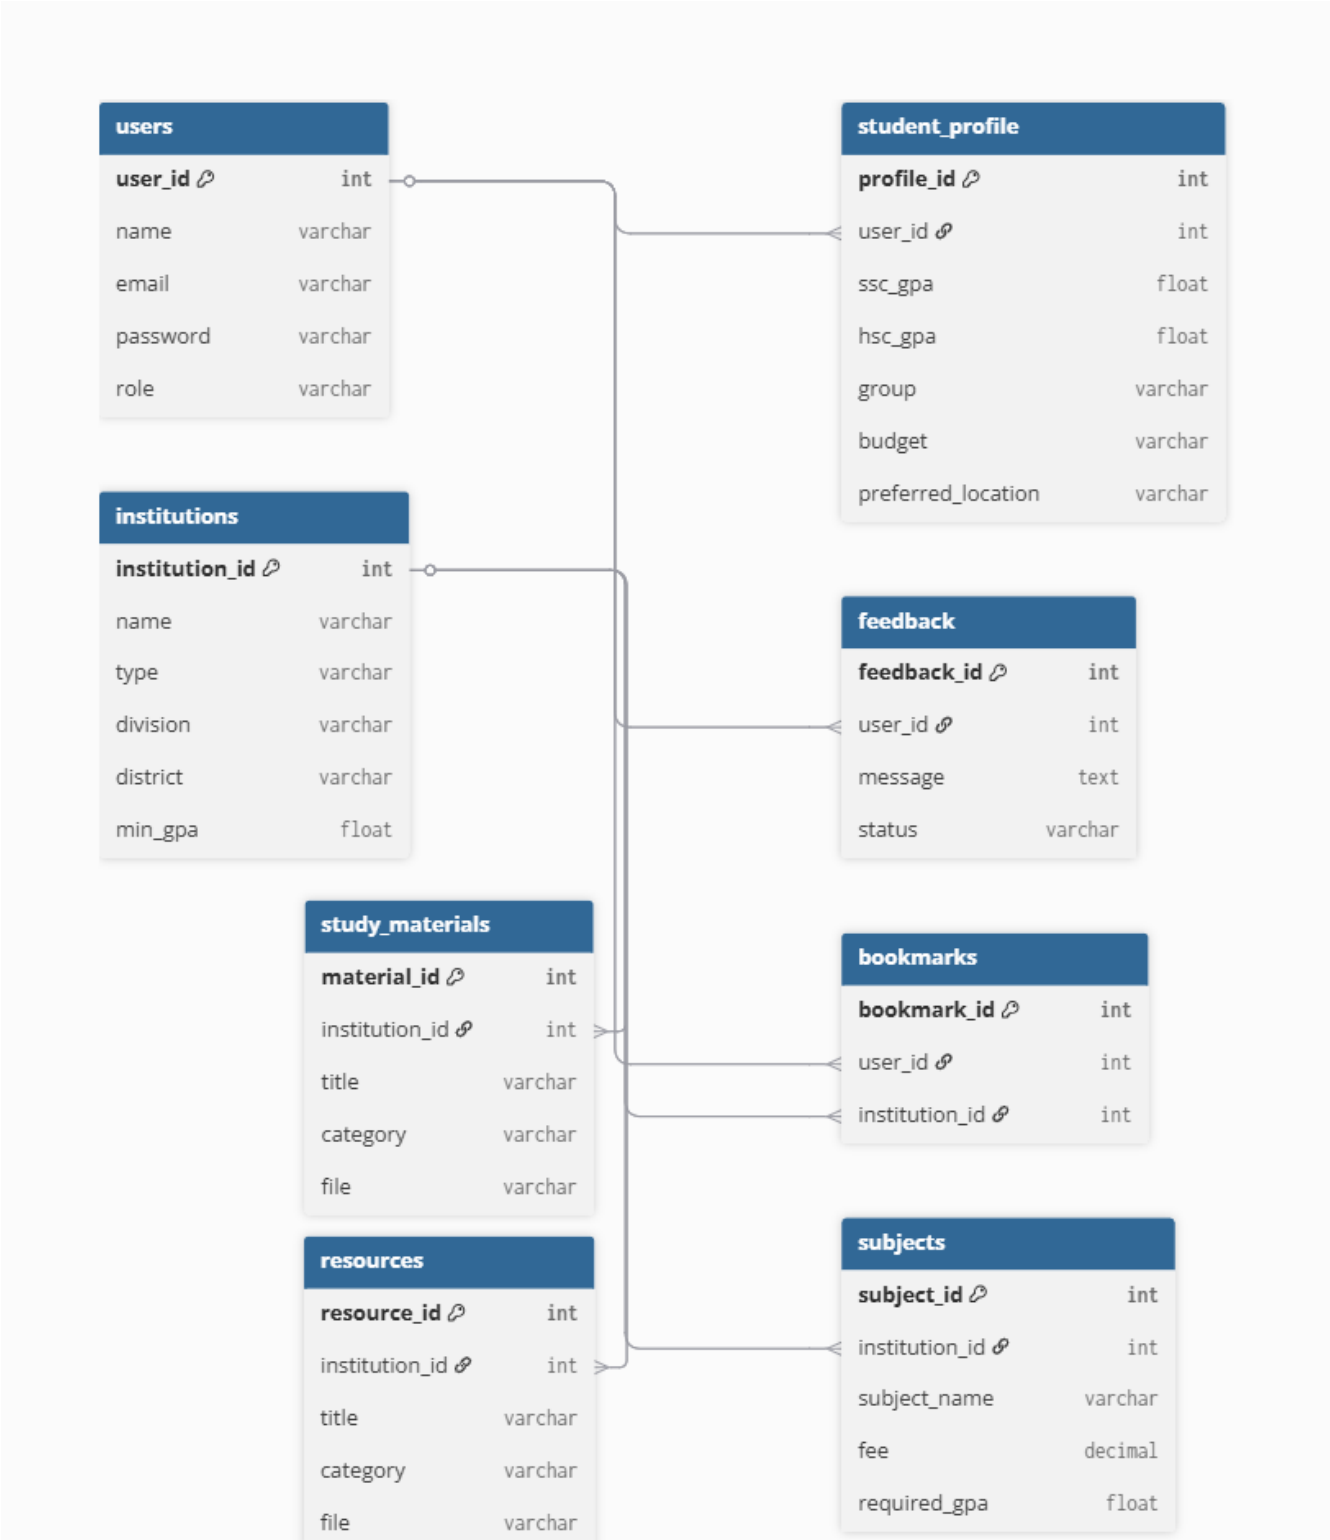

Figure 2.4: Table Relationship Diagram for Database Schema

2.8 Conclusion

This chapter presents the requirement analysis and design foundation of the EduAtlas system. It covers the functional and non-functional requirements, development tools, SDLC selection, system architecture, E-R diagram, and database schema in a structured manner.

The analysis and design clearly define how different components of the system interact to achieve the project objectives. Each part of the system is carefully planned to ensure efficient handling of institution data, academic resources, and user interactions.

The results demonstrate that the system is practical, user-focused, and capable of supporting its intended functionalities. The design decisions contribute to maintaining simplicity, efficiency, and scalability, while the architectural and database structure provide a strong technical foundation for implementation.

Overall, this chapter establishes a clear and organized design framework, preparing the system for successful development and future enhancements.

Chapter 3

Interface Design and Implementation

3.1 System Overview

EduAtlas is implemented as a user-friendly web application that emphasizes simplicity, accessibility, and efficient navigation. The system provides a well-structured interface that allows users to interact with different features smoothly.

The interface design focuses on clarity and usability, enabling users to explore institutions, access resources, and perform actions without complexity. Each module is organized in a way that minimizes user effort and enhances overall interaction with the system.

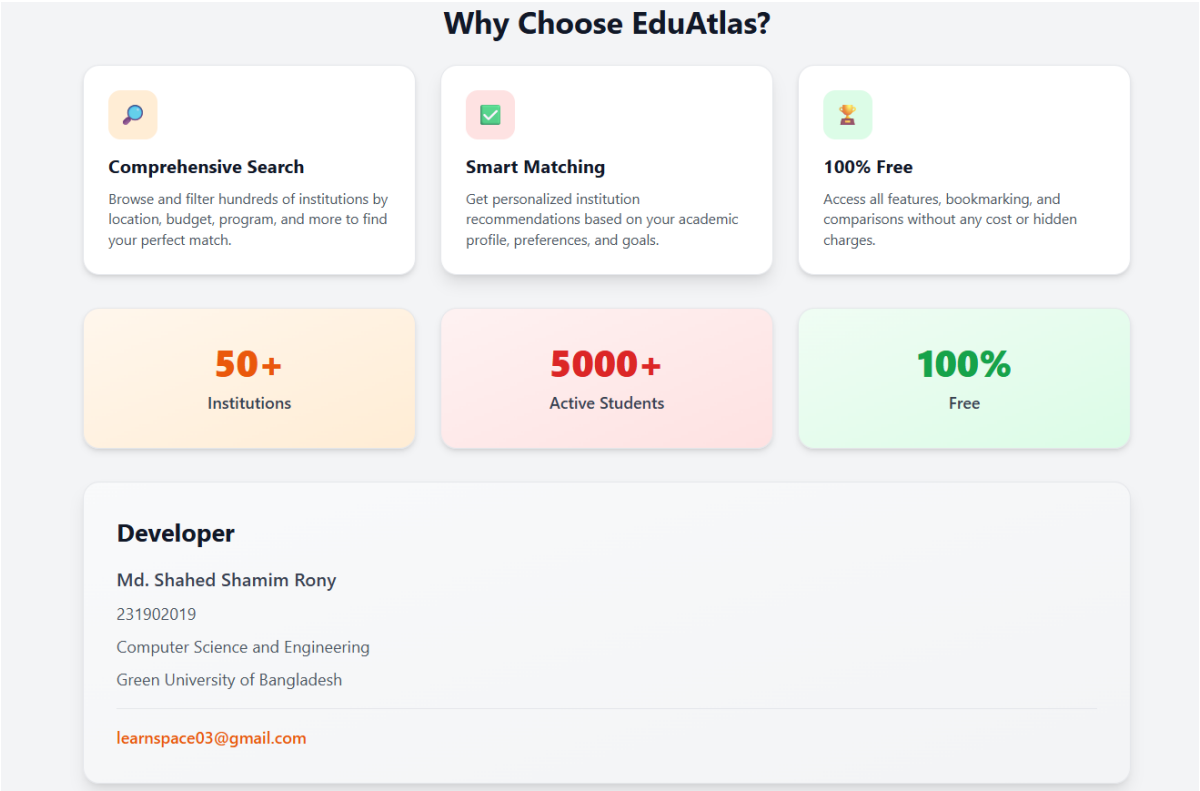

Figure 3.17: About page describing system features, mission, and developer information

3.14 Implementation Flow

The implementation of the EduAtlas system follows a structured development process, integrating both frontend and backend components to ensure smooth functionality.

- Designed the database schema using MySQL to manage users, institutions, study materials, and feedback data.
- Developed backend logic using Laravel to handle data processing, routing, and system operations.
- Implemented user authentication and session management for secure access control.
- Built the frontend interface using Blade templates, HTML, CSS, and Bootstrap for responsive design.
- Integrated core modules such as institution discovery, filtering, bookmarks, admission help, study materials, and feedback system.
- Connected frontend and backend through dynamic data rendering and database interactions.
- Conducted testing on individual modules and resolved identified issues.
- Optimized system performance and user interface for improved usability and responsiveness.

3.15 Conclusion

This chapter presents the implementation of the EduAtlas system, highlighting how the design was translated into a functional web application. The integration of frontend and backend components ensures smooth system operation and effective user interaction.

The implemented features, including institution discovery, document access, and feedback handling, demonstrate the practical usability of the system. The development process ensures that the platform is reliable, efficient, and suitable for real-world use.

Overall, the implementation phase successfully delivers a complete and user-oriented system, providing a strong foundation for future improvements and scalability.

Chapter 4

Testing and Results

4.1 Testing Strategy

Testing is a crucial phase of system development that ensures all components of the EduAtlas system function correctly and meet user requirements. A combination of different testing methods is applied to validate system performance, reliability, and usability.

The testing strategy includes the following approaches:

- **Unit Testing:** Used to test individual components of the system, such as controller functions and specific modules, to ensure they work correctly in isolation.
- **Integration Testing:** Performed to verify the interaction between different modules, such as data flow between the database, backend logic, and user interface.
- **System Testing:** Conducted to evaluate the complete system as a whole and ensure that all features work together properly in an end-to-end environment.
- **User Acceptance Testing (UAT):** Ensures that the system meets user expectations by validating usability, functionality, and overall user experience.

These testing methods help identify errors, improve system stability, and ensure that the EduAtlas platform performs efficiently in real-world scenarios.

4.2 Test Case Implementation

Test cases are designed based on real user actions. Each feature is tested step by step to ensure proper functionality.

Major test areas include:

- Dashboard loading
- Institution search and filtering
- Viewing institution details
- Bookmark functionality
- Downloading documents
- Submitting feedback

All test cases are executed carefully to verify system behavior.

4.3 Test Case Summary Table

The test case results demonstrate that the EduAtlas system performs reliably across all major functionalities. All test cases were executed successfully, and the system produced the expected outputs in each scenario.

The institution discovery and filtering features operate accurately based on user input. The institution details module correctly displays relevant information, and the bookmark functionality allows users to save and manage institutions without errors.

The admission help and study materials modules provide proper access to documents, and the download functionality works as expected. In addition, the feedback system enables users to submit requests and view their history effectively.

Overall, the system shows stable and consistent performance across all modules, confirming its correctness and usability in real-world conditions.

Figure 4.1 shows the detailed test case execution results of the EduAtlas system.

Figure 4.1: Test Case Execution Summary of EduAtlas

4.4 Analysis and Discussion

The testing results show that the EduAtlas system performs reliably across all core functionalities. All modules operate correctly and produce expected outputs.

However, some improvements can be made, such as increasing the dataset—especially for study abroad options—and optimizing system performance for faster response time. Additional filtering features can also enhance user experience.

Overall, the system meets its objectives and provides a stable and functional platform.

4.5 Conclusion

The testing phase confirms that the EduAtlas system functions correctly and maintains stable performance across all modules.

User interactions such as searching, filtering, accessing resources, and submitting feedback work smoothly. Minor improvements identified during testing have been addressed to enhance usability.

Overall, the system is reliable, efficient, and suitable for real-world use.

Chapter 5

Conclusion and Future Work

5.1 Summary of the Project

The EduAtlas system was developed to simplify the process of exploring educational institutions and accessing academic resources for students. The platform enables users to search and filter colleges, universities, and study abroad opportunities based on their preferences. It also provides detailed institution information, downloadable admission documents, categorized study materials, and a feedback system for user interaction.

The system has been successfully deployed , accessible at: https://eduatlas.unaux.com/. This demonstrates its practical usability in real-world scenarios.

Throughout the development process, structured software engineering practices were followed, including requirement analysis, system design, implementation, and testing.

EduAtlas addresses the common problem of scattered educational information by providing a centralized platform. It improves accessibility, reduces user effort, and supports better academic decision-making. The project demonstrates how a well-designed web system can effectively solve real-world problems.

5.2 Societal Impact

The EduAtlas platform contributes positively by improving access to organized educational information and supporting students in making informed decisions.

1. **Improved Access to Information**
   Provides centralized access to institution details, admission documents, and study materials in a structured format.

2. **Time Efficiency**
   Advanced search and filtering reduce the time required to find relevant information.

3. **Support for Academic Planning**
   Helps students select suitable institutions based on their preferences and academic background.

4. **Resource Availability**
   Enables easy access to study materials and admission-related documents.

5. **User Interaction**
   The feedback system allows users to submit requests and suggestions, improving platform responsiveness.

6. **Scalability**
   The system can be extended for broader use by students, institutions, and academic organizations.

Overall, EduAtlas promotes a more efficient and accessible approach to managing educational information.

5.3 Future Work

Although EduAtlas meets its primary objectives, several improvements can enhance its functionality and scalability.

1. **Mobile Application Development**
   Developing a mobile application to improve accessibility and user convenience.

2. **Recommendation System**
   Implementing intelligent recommendations based on user preferences and behavior.

3. **Expanded Content**
   Adding more study materials, including video lectures, notes, and practice exams.

4. **Real-Time Support**
   Introducing live chat or support systems for instant user assistance.

5. **Data Integration**
   Integrating with official institution databases for automated and updated information.

6. **Performance and Security**
   Enhancing system speed, scalability, and data security for large-scale usage.

These improvements will make EduAtlas more robust, user-friendly, and suitable for long-term real-world deployment.
